Software Design and Artitecture

Task No: 01

1. List 9 conceptual classes (just the class names)

1. Customer
2. Restaurant
3. FoodItem
4. Order
5. Delivery
6. Payment
7. Driver
8. Address
9. Review

2. Three important classes with attributes and methods

3. Abstraction decisions (4–5 sentences)

In this system, we use abstractiom to hide unnecessary details and focus on the main features. For example, the payment process is abstracted so we don't need to handle the exact payment gateway details. Similarly, the delivery process is simplified by using a single Delivery class, without showing the exact tracking logic. This helps keep the design clean and easy to manage.

4. One invented software object

OrderValidator – checks if the order details are correct before confirming the order.
